JAN 24 2005

AMENDMENTS TO THE CLAIMS

1. (Currently amended) In an intelligent switched telephone network having a plurality of Advanced Intelligent Network (AIN) components, a method for providing a usage pattern for a customer of a telecommunications system, the usage pattern providing historical information concerning the customer's use of the telecommunications system, the method comprising:
 - communicating with a data network and receiving a query for the customer's usage pattern, the query originating from the customer using a computer device operating on the data network;
 - acquiring the usage pattern from a database communicating with a service control point;
 - causing the usage pattern to be communicated along the data network to the computer device;
 - causing the historical information of the usage pattern to be compared with a predetermined billing plan; ~~and~~
 - displaying unused minutes remaining in the predetermined billing plan on the computer device to control the use of the telecommunications system based on the unused minutes,
 - whereby the customer uses the computer device to access the usage pattern; and
 - allowing the customer to learn an identity of an unrecognized telephone number placing a call to the customer, thereby preventing the customer from calling a service provider to learn the identity of the unrecognized telephone number.
2. (Previously presented) A method for providing a usage pattern according to claim 1, wherein the step of acquiring the usage pattern comprises at least one of i) acquiring the usage pattern from a service control point operating on the telecommunications system and ii) acquiring the usage pattern from a database operating on the data network.

3. (Previously presented) A method for providing a usage pattern according to claim 1, wherein the step of acquiring the usage pattern comprises at least one of i) acquiring the number of telephone calls made by the customer and ii) acquiring the number of telephone calls received by the customer.
4. (Previously presented) A method for providing a usage pattern according to claim 1, wherein the step of acquiring the usage pattern comprises acquiring at least one of i) a telephone number called by the customer, ii) a name of a party called by the customer, and iii) an address of the party called by the customer.
5. (Previously presented) A method for providing a usage pattern according to claim 1, wherein the step of acquiring the usage pattern comprises acquiring at least one of i) a telephone number of a party placing a call to the customer, ii) a name of a calling party, and iii) an address of the calling party.
6. (Previously presented) A method for providing a usage pattern according to claim 1, wherein the step of acquiring the usage pattern comprises acquiring information concerning at least one of i) a date of a telephone call made by the customer, ii) a time the telephone call was made by the customer, iii) a duration of the telephone call, and iv) information identifying the called party.
7. (Previously presented) A method for providing a usage pattern according to claim 1, wherein the step of acquiring the usage pattern comprises acquiring information concerning at least one of i) a date of a telephone call received by the customer, ii) a time the telephone call was received by the customer, iii) a duration of the telephone call, and iv) information identifying the calling party.
8. (Previously presented) A method for providing a usage pattern according to claim 1, wherein the step of acquiring the usage pattern comprises acquiring information concerning the identity of a calling party terminating a telephone call

before the telephone call is answered.

9. (Previously presented) A method for providing a usage pattern according to claim 1, wherein the step of acquiring the usage pattern comprises acquiring at least one of i) total number of calls made during a chronological interval, ii) total number of calls made during a calendar interval, and iii) total number of calls made during a billing cycle.
10. (Previously presented) A method for providing a usage pattern according to claim 1, wherein the step of acquiring the usage pattern comprises acquiring at least one of i) total number of calls received during a chronological interval, ii) total number of calls received during a calendar interval, and iii) total number of calls received during a billing cycle.
11. (Previously presented) A method for providing a usage pattern according to claim 1, wherein the step of acquiring the usage pattern comprises acquiring at least one of i) billing information concerning a call made by the customer and ii) billing information concerning a call received by the customer.
12. (Previously presented) A method for providing a usage pattern according to claim 1, wherein the step of acquiring the usage pattern comprises acquiring information concerning unused minutes remaining in a billing cycle.
13. (Previously presented) A method for providing a usage pattern according to claim 1, further comprising verifying an identity of the customer to help ensure privacy of the usage pattern.
14. (Currently amended) A method for providing a usage pattern for a subscriber of a telecommunications system, the usage pattern providing information concerning the subscriber's use of the telecommunications system, the method comprising:
communicating with a data network and receiving a query for the

customer's usage pattern, the query originating from the customer using a computer device operating on the data network;

verifying an identity of the customer to help ensure privacy of the usage pattern;

acquiring the usage pattern, the usage pattern comprising at least one of the number of telephone calls made by the customer during a billing cycle,

the number of telephone calls received by the customer during the billing cycle,

telephone numbers called by the customer during the billing cycle,

telephone numbers calling the customer during the billing cycle,

date of each telephone call made by the customer during the billing cycle,

time of each telephone call made by the customer during the billing cycle,

duration of each telephone call made by the customer during the billing cycle,

identity of a calling party terminating a call before the customer answers the call, and

the number of unused minutes remaining in the billing cycle;

causing the usage pattern to be communicated along the data network to the computer device;

causing the acquired usage pattern to be compared with a predetermined billing plan of the billing cycle; and

displaying unused minutes remaining in the predetermined billing plan on the computer device to control the use of the telecommunications system based on the unused minutes,

whereby the customer uses the computer device to access the usage pattern; and

allowing the customer to learn an identity of an unrecognized telephone number placing a call to the customer, thereby preventing the customer from calling a service provider to learn the identity of the unrecognized telephone number.

15. (Currently amended) In an intelligent switched telephone network having a plurality of Advanced Intelligent Network (AIN) components, a method for providing a usage pattern for a customer of a telecommunications system, the usage pattern providing historical information concerning the customer's use of the telecommunications system, the method comprising:

receiving a query for the usage pattern, the query originating from a device communicating with the telecommunications system;

causing the telecommunications system to acquire the usage pattern from at least one of i) a service control point and ii) a data network, the service control point operating on the telecommunications system and comprising the usage pattern for the customer, the data network communicating with the service control point and also comprising the usage pattern for the customer;

causing the usage pattern to be routed along the telecommunications system to the device;

causing the historical information of the usage pattern to be compared with a predetermined billing plan; and

displaying unused minutes remaining in the predetermined billing plan on the device to control the use of the telecommunications system based on the unused minutes,

whereby the customer uses the device to access the usage pattern; and

allowing the customer to learn an identity of an unrecognized telephone number placing a call to the customer, thereby preventing the customer from calling a service provider to learn the identity of the unrecognized telephone number.

16. (Previously presented) A method for providing a usage pattern according to claim 15, further comprising causing the usage pattern to be communicated from the data network to the telecommunications system.

17. (Previously presented) A method for providing a usage pattern according to

claim 15, wherein the step of receiving a query for the usage pattern comprises receiving the query from at least one of i) a wireless personal digital assistant communicating with the telecommunications system, ii) a wireless mobile telephone communicating with the telecommunications system, iii) a wireless pager communicating with the telecommunications system iv) and a wireless computer device communicating with the telecommunications system.

18. (Previously presented) A method for providing a usage pattern according to claim 15, wherein the step of causing the usage pattern to be routed comprises communicating at least one of i) the number of telephone calls made by the customer and ii) the number of telephone calls received by the customer.
19. (Previously presented) A method for providing a usage pattern according to claim 15, wherein the step of causing the usage pattern to be routed comprises communicating at least one of i) a telephone number called by the customer, ii) a name of a party called by the customer and iii) an address of the party called by the customer.
20. (Previously presented) A method for providing a usage pattern according to claim 15, wherein the step of causing the usage pattern to be routed comprises communicating at least one of i) a telephone number of a party placing a call to the customer, ii) a name of a calling party, and iii) an address of the calling party.
21. (Previously presented) A method for providing a usage pattern according to claim 15, wherein the step of causing the usage pattern to be routed comprises communicating information concerning at least one of i) a date of a telephone call made by the customer, ii) a time the telephone call was made by the customer, iii) a duration of the telephone call, and iv) information identifying the called party.
22. (Previously presented) A method for providing a usage pattern according to claim 15, wherein the step of causing the usage pattern to be routed comprises

communicating information concerning at least one of i) a date of a telephone call received by the customer, ii) a time the telephone call was received by the customer, iii) a duration of the telephone call, and iv) information identifying the calling party.

23. (Previously presented) A method for providing a usage pattern according to claim 15, wherein the step of causing the usage pattern to be routed comprises communicating information concerning the identity of a calling party terminating a telephone call before the customer answers the telephone call.
24. (Previously presented) A method for providing a usage pattern according to claim 15, wherein the step of causing the usage pattern to be routed comprises communicating at least one of i) total number of calls made during a chronological interval, ii) total number of calls made during a calendar interval, and iii) total number of calls made during a billing cycle.
25. (Previously presented) A method for providing a usage pattern according to claim 15, wherein the step of causing the usage pattern to be routed comprises communicating at least one of i) total number of calls received during a chronological interval, ii) total number of calls received during a calendar interval, and iii) total number of calls received during a billing cycle.
26. (Previously presented) A method for providing a usage pattern according to claim 15, wherein the step of causing the usage pattern to be routed comprises communicating at least one of i) billing information concerning a call made by the customer and ii) billing information concerning a call received by the customer.
27. (Previously presented) A method for providing a usage pattern according to claim 15, wherein the step of causing the usage pattern to be routed comprises communicating information concerning unused minutes remaining in a billing cycle.

28. (Previously presented) A method for providing a usage pattern according to claim 15, further comprising verifying an identity of the customer to help ensure privacy of the usage pattern.
29. (Currently amended) A method for providing a usage pattern for a customer of a telecommunications system, the usage pattern providing historical information concerning the customer's use of the telecommunications system, the method comprising:
- receiving a query for the usage pattern, the query originating from a device communicating with the telecommunications system;
 - verifying an identity of the customer to help ensure privacy of the usage pattern;
 - causing the telecommunications system to acquire the usage pattern for the customer, the usage pattern comprising at least one of
 - the number of telephone calls made by the customer during a billing cycle,
 - the number of telephone calls received by the customer during the billing cycle,
 - telephone numbers called by the customer during the billing cycle,
 - telephone numbers calling the customer during the billing cycle,
 - date of each telephone call made by the customer during the billing cycle,
 - time of each telephone call made by the customer during the billing cycle,
 - duration of each telephone call made by the customer during the billing cycle,
 - identity of a calling party terminating a call before the customer answers the call, and
 - the number of unused minutes remaining in the billing cycle;
 - causing the usage pattern to be routed along the telecommunications

system to the device;

causing the historical information of the usage pattern to be compared with a predetermined billing plan of the billing cycle;~~and~~

displaying unused minutes remaining in the predetermined billing plan on the device to control the use of the telecommunications system based on the unused minutes,

whereby the customer uses the device to access the usage pattern; and allowing the customer to learn an identity of an unrecognized telephone number placing a call to the customer, thereby preventing the customer from calling a service provider to learn the identity of the unrecognized telephone number.

30. (Currently amended) A method of acquiring a usage pattern for a customer of a telecommunications system, the usage pattern providing historical information concerning the customer's use of the telecommunications system, the method comprising:

acquiring the usage pattern from at least one of i) the telecommunications system and ii) a data network, the usage pattern comprising at least one of the number of telephone calls made by the customer during a billing cycle, the number of telephone calls received by the customer during the billing cycle,

telephone numbers called by the customer during the billing cycle, telephone numbers calling the customer during the billing cycle, date of each telephone call made by the customer during the billing cycle, time of each telephone call made by the customer during the billing cycle, duration of each telephone call made by the customer during the billing cycle,

identity of a calling party terminating a call before the customer answers the call, and

the number of unused minutes remaining in the billing cycle; displaying the acquired usage pattern via a user interface on a device;

comparing the historical information of the usage pattern with a predetermined billing plan of the billing cycle;-and

displaying unused minutes remaining in the predetermined billing plan on the device to control the use of the telecommunications system based on the unused minutes.; and

allowing the customer to learn an identity of an unrecognized telephone number placing a call to the customer, thereby preventing the customer from calling a service provider to learn the identity of the unrecognized telephone number.

31. (Previously presented) A method of acquiring a usage pattern according to claim 30, wherein the step of displaying the acquired usage pattern comprises displaying the acquired usage pattern via a user interface on a device coupled to the telecommunications system.
32. (Previously presented) A method of acquiring a usage pattern according to claim 30, wherein the step of displaying the acquired usage pattern comprises displaying the acquired usage pattern via a user interface on a wireless communication device coupled to the telecommunications system.
33. (Previously presented) A method of acquiring a usage pattern according to claim 30, wherein the step of displaying the acquired usage pattern comprises displaying the acquired usage pattern via a user interface on a device coupled to the data network.
34. (Currently amended) A system for providing a usage pattern for a customer of a telecommunications system, the usage pattern providing historical information concerning the customer's use of the telecommunications system, the system comprising:
 - a database of usage patterns, each usage pattern comprising at least one of the number of telephone calls made by the customer during a billing

cycle,

the number of telephone calls received by the customer during the billing cycle,

telephone numbers called by the customer during the billing cycle,

telephone numbers calling the customer during the billing cycle,

date of each telephone call made by the customer during the billing cycle,

time of each telephone call made by the customer during the billing cycle,

duration of each telephone call made by the customer during the billing cycle,

identity of a calling party terminating a call before the customer answers the call, and

the number of unused minutes remaining in the billing cycle; and

a processor accessing the database of usage patterns, acquiring the usage pattern, causing the historical information of the usage pattern to be compared with a predetermined billing plan of the billing cycle, ~~and~~ displaying unused minutes remaining in the predetermined billing plan to control the use of the telecommunications system based on the unused minutes; and allowing the customer to learn an identity of an unrecognized telephone number placing a call to the customer, thereby preventing the customer from calling a service provider to learn the identity of the unrecognized telephone number.

35. (Currently amended) A public switched telephone network for processing a telephone call, comprising the following Advanced Intelligent Network (AIN) component:

a Service Control Point processing system for providing usage pattern service to a subscriber, the Service Control Point processing system comprising a processor accessing a database of usage patterns, each usage pattern comprising at least one of i) the number of telephone calls made by the customer during a billing cycle,

ii) the number of telephone calls received by the customer during the billing cycle, iii) telephone numbers called by the customer during the billing cycle, iv) telephone numbers calling the customer during the billing cycle, v) date of each telephone call made by the customer during the billing cycle, vi) time of each telephone call made by the customer during the billing cycle, vii) duration of each telephone call made by the customer during the billing cycle, viii) identity of a calling party terminating a call before the customer answers the call, and ix) the number of unused minutes remaining in the billing cycle,

wherein information of the usage pattern is compared with a predetermined billing plan of the billing cycle and unused minutes remaining in the predetermined billing plan is displayed to the subscriber, thereby allowing the subscriber to control a use of the telephone call and allowing the customer to learn an identity of an unrecognized telephone number placing a call to the customer, thereby preventing the customer from calling a service provider to learn the identity of the unrecognized telephone number.

36. (Cancelled)
